

Alexis Montenegro, MBA

Executive Portfolio Highlights

**Marketing Operations • Revenue Operations • Business Systems • AI
& Operational Strategy**

**Building scalable systems that connect marketing, technology, and
business operations.**

"Technology should make organizations easier to operate, not more complicated."

Building Organizations That Scale

Throughout my career, I've been drawn to the same kind of work.

Organizations reach a point where growth begins to expose weaknesses. Processes that once worked become difficult to manage. Teams create their own ways of working. Data becomes fragmented. Reporting loses consistency. Technology no longer reflects how the business actually operates.

Those challenges rarely have a single solution.

Sometimes the answer is a new platform. Sometimes it's a better process. More often, it's helping people align around a shared way of working.

That has been the focus of my career.

I've led CRM implementations, introduced enterprise work management platforms, developed marketing attribution frameworks, built reporting systems for executive leadership, and established governance that allows organizations to continue improving long after implementation is complete. The technology changes. The work doesn't. My role is to create clarity, reduce operational friction, and build systems that help organizations keep growing.

Every project in this portfolio reflects the same goal: helping organizations build systems that make growth easier instead of more complicated.

For readers interested in the implementation details, each case study includes a reference to the corresponding section of my complete Executive Portfolio.

What You Can Expect

Across these case studies, several themes appear consistently.

- Leading organizational change through collaboration rather than mandate.
- Designing systems around business needs instead of technology.
- Building governance that supports long-term scalability.
- Giving leadership better visibility through reliable data and reporting.
- Creating operational improvements that continue delivering value after implementation.

These principles have guided every major initiative I've led and continue to shape how I approach new challenges.

Executive Case Study 1

Leading Organizational Change Across a Growing Marketing Organization

Executive Challenge

As GoodLeap's marketing organization expanded, teams had naturally adopted different ways of managing work. Some relied on Smartsheet, others used Jira or Google Sheets, and in some cases work wasn't tracked in a formal system at all. While each approach worked for an individual team, it became increasingly difficult to coordinate projects across the department, understand priorities, or give leadership a clear view of ongoing work. **The platform supported the change, but the real success came from giving every team a common way of working.**

Leadership Approach

Rather than beginning with software demonstrations or predefined workflows, I started by meeting with each functional team to understand how they worked, where existing processes created friction, and which capabilities they felt were missing. Those conversations shaped the implementation strategy.

That approach also helped build trust. Instead of asking teams to abandon successful processes, I looked for opportunities to preserve what already worked while introducing standards that improved collaboration across the department. Executive support developed in the same way. The initial proposal wasn't approved immediately, so I continued refining the business case, incorporating stakeholder feedback, and demonstrating how a shared platform could improve visibility, accountability, and operational efficiency.

Once the initiative moved forward, the work extended well beyond configuring monday.com. I designed governance standards, created workflows, documented processes, developed training materials, and supported adoption across the department. I wanted people to feel confident using the platform on day one and continue trusting it long after the rollout was complete. Practical documentation and lightweight training resources helped teams adopt new processes without lengthy manuals or formal training sessions.

Business Outcome

The implementation established a shared framework for managing work across approximately twenty members of the marketing organization, improving project visibility, communication, and consistency. According to your documented project results, project delivery speed increased by 38% while communication errors were reduced through automated updates. More importantly, the initiative reinforced a lesson that has shaped every major implementation I've led since: technology creates value only when people understand it, trust it, and choose to use it.

Executive Competencies

- Organizational Change Management
- Executive Communication
- Cross-functional Leadership
- Stakeholder Engagement
- Governance & Process Design
- Business Systems Strategy
- Training & Adoption
- Project Portfolio Management

Continue Reading

This overview highlights the leadership strategy behind the implementation. The complete case study explores the evaluation process, stakeholder alignment, executive buy-in, governance framework, workflow design, training strategy, adoption planning, and lessons learned from leading organizational change across a growing marketing organization.

Executive Case Study 2

Designing the Operating Model for Scalable Growth

Executive Challenge

When I joined the firm, marketing and intake were operating without a dedicated system for managing prospective clients. MyCase served as the firm's case management platform, but it wasn't designed to support lead management, lifecycle marketing, or marketing attribution. Leadership had limited visibility into where leads came from, how they moved through the sales process, or which marketing investments were generating meaningful business results. Reporting was largely manual, making it difficult to measure performance or make informed decisions as the firm continued to grow.

A CRM only creates value when it reflects how the business actually operates.

Leadership Approach

Before configuring a single workflow, I mapped the firm's customer journey from the first inquiry through client retention. That process helped identify where information was being captured, where handoffs occurred, and where visibility was being lost. Rather than forcing the organization to adapt to HubSpot's default structure, I designed the platform around the firm's existing business processes.

I recommended positioning HubSpot as the firm's lead CRM while keeping MyCase focused on active client management. Separating those responsibilities created a cleaner operational model, improved reporting, and allowed each platform to do what it was designed to do.

The implementation extended well beyond CRM configuration. I secured executive approval, designed the CRM architecture, created custom properties and lifecycle stages, developed more than 100 automated workflows, built 15 Zapier automations, integrated Slack and Google Sheets, documented processes, trained users across multiple countries, and continue to manage the platform as the business evolves. Every decision came back to the same question: *Would this make the system easier to understand, easier to trust, and easier to build on over time?*

Business Outcome

The result was more than a successful CRM implementation. The firm established a centralized operational platform supporting approximately 40 users and more than 55,000 contacts. Marketing and sales gained reliable attribution, standardized lifecycle management, improved reporting, and executive dashboards that connected marketing activity to business performance. Lead response time improved by 44%, data quality became more consistent, and leadership finally had a shared source of truth for measuring growth and guiding future decisions.

Looking back, the CRM did more than improve technology. It gave Marketing, Booking, Intake, and leadership a shared way of working built around the same data, the same processes, and the same definition of success.

Executive Competencies

- Revenue Operations Strategy
- CRM Architecture & Governance
- Executive Stakeholder Management
- Organizational Change Management
- Marketing & Sales Alignment
- Data Governance
- Business Process Design
- Executive Reporting & Analytics

Executive Case Study 3

Giving Leadership Better Decisions Through Better Data

Executive Challenge

As the firm's investment in digital marketing grew, so did the need for better measurement. Marketing generated leads through multiple channels, but leadership couldn't confidently answer some of the most important questions.

Which campaigns produced qualified consultations?

Which marketing investments resulted in retained clients?

Where were prospective clients dropping out of the sales process?

The available data answered pieces of those questions, but not the whole story. Digital form submissions could be tracked, while phone calls, the firm's primary source of new business, relied on employees asking callers how they heard about the firm. The information was inconsistent, incomplete, and often impossible to validate. Without reliable attribution, it became difficult to evaluate marketing performance, measure return on investment, or make informed budget decisions.

Leadership Approach

Leadership gained confidence because everyone was finally working from the same information.

The first priority was creating consistent data. I established campaign naming standards across Google Ads, Meta Ads, SEO, referral campaigns, and other marketing initiatives so every campaign followed the same structure. I also implemented standardized UTM governance, ensuring marketing data remained intact as prospective clients moved from advertising platforms into HubSpot.

To close the gap around inbound phone calls, I evaluated call attribution platforms, recommended CallRail, built the business case for implementation, and oversaw its integration with HubSpot and the firm's contact center. Bringing those systems

together created a much clearer picture of the customer journey and gave leadership visibility they simply hadn't had before.

With reliable data in place, I designed executive dashboards that connected marketing activity to business outcomes. Conversations shifted away from channel metrics and toward questions that mattered to the business: Which investments produced qualified opportunities? Which campaigns generated retained clients? Where were operational bottlenecks affecting conversion? Instead of debating the accuracy of reports, leadership could focus on improving performance.

Business Outcome

As confidence in the data grew, leadership could spend less time questioning reports and more time making decisions.

Marketing, Booking, Intake, and executive leadership began working from the same data, using the same definitions, and measuring success in the same way. Marketing could evaluate campaign quality instead of lead volume alone. Sales leaders gained visibility into response times and conversion rates. Leadership could make investment decisions with greater confidence because reporting reflected the entire customer journey rather than isolated platform metrics.

The attribution framework also became the foundation for future initiatives. It supported the transition of paid media from an external agency to an internal function and continues to evolve as new campaigns, platforms, and services are introduced. Rather than creating a static reporting system, the project established an operational framework that grows with the business.

Executive Competencies

- Executive Reporting & Decision Support
- Marketing Attribution Strategy
- Revenue Operations
- Data Governance
- Cross-functional Alignment
- Business Intelligence
- CRM & Analytics Integration
- Performance Measurement

Continue Reading

This overview focuses on the business strategy behind the attribution framework. The complete case study explores the evaluation of CallRail, campaign taxonomy, UTM governance, CRM integration, executive dashboard design, and the reporting architecture that supports ongoing optimization.

Executive Case Study 4

Building an AI Operating System for Better Decisions

Executive Challenge

As my responsibilities expanded across CRM administration, marketing operations, reporting, paid media, vendor management, and executive communication, I noticed a common pattern. The challenge wasn't creating new information. It was managing the growing volume of knowledge that already existed.

Meeting notes, implementation decisions, technical research, project documentation, emails, and Slack conversations all contained valuable context. Finding the right information at the right time was becoming increasingly difficult, and too much time was being spent searching for previous work instead of building on it.

The greatest opportunity for AI is helping people make better decisions, not replacing the people making them.

Leadership Approach

Instead of adopting AI to automate decisions, I designed a framework that keeps people at the center while reducing the friction that slows them down.

I built a knowledge management workflow that allows meeting transcripts, documentation, implementation notes, research, and supporting materials to be accessed through natural language rather than manual file searches. Instead of trying to remember where information was stored, I could ask questions about previous projects, implementation decisions, or unresolved issues and immediately retrieve the context needed to move work forward.

AI also became a technical partner throughout my work. During CRM implementations, workflow automation, reporting projects, and custom development, I used AI to accelerate research, validate workflow logic, troubleshoot technical issues, and explore implementation options. The technology helped generate possibilities, but every recommendation was evaluated against business requirements, operational constraints, and long-term maintainability before becoming part of the solution.

One lesson has shaped every AI project I've worked on: technology should support human judgment, not replace it. Decisions that affect clients, employees, budgets, or organizational strategy still require experience, judgment, and accountability. AI supports those decisions. It does not replace them. That principle has guided every workflow I've developed.

Business Outcome

The biggest improvement was how work flowed from one task to the next. Less time was spent searching for information, recreating previous work, or retracing decisions. More time could be spent solving problems and moving projects forward.

Research that once required hours can often be completed in minutes. Documentation is easier to maintain. Complex technical problems can be explored more efficiently. Executive communications have become more consistent because institutional knowledge is easier to retrieve and apply. Most importantly, I've been able to spend more time solving business problems instead of searching for information or recreating work that already existed.

What began as a personal productivity initiative evolved into a practical operating model for managing organizational knowledge. It reinforced a belief that now influences every technology decision I make: the organizations that benefit most from AI won't be the ones that use it to replace people. They'll be the ones that use it to strengthen decision-making, preserve knowledge, and help their teams work more effectively.

Executive Competencies

- AI Strategy & Governance
- Knowledge Management
- Operational Productivity
- Executive Communication
- Business Process Design
- Change Leadership
- Workflow Automation
- Technology Evaluation

Executive Case Study 5

Aligning Marketing Around Business Growth

Executive Challenge

When I joined the firm, paid media was managed externally while SEO, content, lifecycle marketing, and other growth initiatives operated independently. Each channel produced useful data, but they weren't working together as a coordinated growth strategy. Leadership needed more than stronger campaign performance. They needed confidence that marketing investments were producing measurable business results and a framework that could continue to scale as the firm grew.

Leadership Approach

Rather than optimizing individual channels in isolation, I focused on building an integrated growth strategy.

Paid media management was brought in-house, allowing campaign strategy, landing pages, CRM data, attribution, and reporting to be managed as a single system instead of across disconnected teams. At the same time, I expanded SEO initiatives, strengthened technical optimization, introduced bilingual content, developed lifecycle marketing campaigns, and aligned every major marketing initiative with the customer journey inside HubSpot.

Just as importantly, I established a consistent process for measuring success. Marketing decisions were no longer based solely on impressions, clicks, or lead volume. Campaigns were evaluated using CRM data, conversion quality, client acquisition, and business outcomes. That shift allowed marketing conversations to move beyond channel performance and focus on how each investment contributed to the firm's long-term growth strategy.

Business Outcome

Growth became more predictable because every marketing channel was working toward the same business objectives.

After bringing paid media management in-house, qualified paid leads increased by **188%**, new client acquisition increased by **88%**, and acquisition costs were reduced by approximately **50%**. At the same time, SEO initiatives increased Google Search impressions by **192%**, organic clicks by **94%**, organic traffic by **89%**, and Top 3 keyword rankings by **110%**, improving average search position from **10.3 to 5.8**. Lifecycle marketing also strengthened engagement across a database of approximately **20,000 contacts**, producing a **32% average open rate**, **5.09% click rate**, and **15.91% click-to-open rate**.

The performance metrics mattered, but what stayed with me was how much easier it became for leadership to understand where growth was coming from and where to invest next. Marketing became more coordinated because every channel was connected through shared data, consistent reporting, and a common strategy. Leadership gained greater confidence in where to invest, which initiatives to expand, and how marketing contributed to the firm's broader business objectives.

Executive Competencies

- Growth Strategy
- Marketing Operations
- Revenue Operations
- Budget & Investment Management
- Performance Marketing
- SEO Strategy
- Lifecycle Marketing
- Executive Reporting
- Cross-functional Leadership

Continue Reading

This overview highlights the leadership strategy behind the firm's growth initiatives. The complete case study explores campaign planning, channel strategy, SEO implementation, paid media optimization, lifecycle marketing, attribution, reporting, and the operational framework used to measure long-term business performance.

Leading Through Systems, Not Just Technology

Over the course of my career, I've worked on CRM implementations, marketing attribution, AI, paid media, SEO, reporting, automation, and organizational change. On the surface, those projects appear very different.

What connects them is the way I approach the work.

The longer I do this work, the more convinced I become that most operational problems start long before anyone notices the technology. More often, growth exposes weaknesses in the systems supporting the business. Information becomes harder to find. Teams develop different ways of working. Reporting becomes inconsistent. Technology accumulates faster than governance. Eventually, the organization spends more time managing complexity than creating value.

Those are the kinds of problems I enjoy solving.

Before recommending software or redesigning a process, I spend time understanding how the business actually operates. I want to know where work slows down, where decisions rely on assumptions instead of data, and where employees encounter unnecessary friction. Those conversations often reveal that the original request isn't the real problem. Solving the underlying issue usually leads to a better outcome than simply implementing another tool.

I've also learned that successful change has very little to do with technology alone.

People support change when they understand why it matters, when they're included in the process, and when the end result genuinely makes their work easier. Whether I'm implementing a CRM, introducing AI, redesigning marketing operations, or partnering with outside vendors, my responsibility is to build trust as carefully as I build systems. Adoption is not something that happens after implementation. It's part of the implementation.

Documentation is another principle that shapes my work. I don't create documentation because every organization should have a binder full of procedures. I create it because documenting a process forces us to understand it. It exposes unnecessary complexity, preserves institutional knowledge, improves onboarding, and makes future

improvements easier. Well-designed systems should continue working long after the original project team has moved on.

The same philosophy guides how I think about governance. As organizations grow, it's easy for workflows, dashboards, automations, and custom properties to multiply until they become difficult to maintain. I've found that simpler systems almost always outperform more complicated ones. My goal is to create environments that are understandable, maintainable, and resilient as the business continues to evolve.

Technology will continue to evolve, but the principles behind successful organizations remain remarkably consistent. Listen first. Solve the business problem before choosing the technology. Design systems people trust enough to use every day. Looking back across these projects, those principles show up every time, and they're the same principles I bring to every organization I have the opportunity to serve.

Continue Reading

The projects in this document are executive summaries of larger initiatives. Each one is explored in greater detail in my **Executive Portfolio**, including planning documents, implementation strategy, governance decisions, lessons learned, and measurable business outcomes.

If you're interested in how these projects evolved from initial business challenges to long-term operational improvements, I invite you to continue reading the complete portfolio.

Executive Highlights

Leadership Experience

- More than a decade leading marketing operations, business systems, CRM strategy, and revenue operations initiatives.
- Experience supporting executive leadership across legal services, financial services, insurance, and fintech organizations.
- Trusted to lead initiatives that required collaboration across marketing, sales, intake, operations, technology, compliance, and executive leadership.
- MBA with a systems-oriented approach to organizational growth and operational excellence.

Areas of Expertise

- Marketing Operations
- Revenue Operations
- Business Systems Strategy
- CRM Architecture & Governance
- Organizational Change Management
- AI Strategy & Knowledge Management
- Executive Reporting & Analytics
- Marketing Attribution
- Process Improvement
- Cross-functional Leadership

Representative Business Impact

- Led enterprise CRM implementation supporting approximately 40 users and more than 55,000 contacts.
- Implemented more than 100 HubSpot workflows and 15 system integrations to improve operational efficiency.
- Improved paid media performance while reducing acquisition costs by approximately 50%.
- Increased qualified paid leads by 188% and new client acquisition by 88%.
- Increased organic search impressions by 192% and organic traffic by 89%.

- Developed executive reporting frameworks that connected marketing activity to measurable business outcomes.
- Led organization-wide adoption of enterprise work management platforms through governance, documentation, and change management.

Leadership Philosophy

The strongest systems are the ones people trust enough to use every day.

My goal has never been to implement technology for its own sake. It's to help organizations operate with greater clarity, stronger alignment, and better information so leaders can make confident decisions and teams can do their best work.

Thank You

Thank you for taking the time to review my Executive Portfolio Highlights.

Every organization reaches moments where growth creates new operational challenges. Those are the opportunities I enjoy most. Whether improving marketing operations, modernizing business systems, strengthening revenue operations, or helping teams adopt new ways of working, my focus is simple: help organizations build systems that support their people today and continue serving them as they grow.

If you'd like to discuss any of the projects summarized here or explore how my experience could support your organization, I'd welcome the opportunity to connect.

Alexis Montenegro, MBA

Director, Marketing Operations | Revenue Operations | Business Systems
